

DKiAdmin, Version 4.3.3

DKiAdmin, Version 4.3.3, fixes a download runtime error that exists in all previous versions of DKiAdmin. The error occurs when downloading new versions of DK280, DK424, DK40i, and DK424i R4.3 software. The problem exists with DK and DKi ROM versions that are identified with a new scheme of two letters (AA, AB, etc.) as opposed to the old scheme of a number and a letter (8R, 9M, 9Y, etc.).

Upgrade your existing version of DKiAdmin to Version 4.3.3 to correct the above problem.

Installing DKiAdmin from FYI

1. Download each of the two disks from FYI to a directory on your hard drive.
2. Unzip each disk to a separate formatted 1.44mb floppy.
3. Insert Disk1 in the A: (or B) floppy drive and RUN setup.exe.
4. Follow the install prompts - this is a Windows install routine but DKi Admin is still a DOS program.
5. To run the program, click on the DKi Admin icon located on the Desktop; or, go to Start/Programs/Strata DK and click on DKi Admin.
